

Intelligent Infrastructure

Providing technical leadership

Intelligent Infrastructure in Network Rail

We are using technology to turn **data into intelligent information** so our teams can **work smarter** and **more safely** to deliver improved services for passengers and freight customers.

People & culture transformation

Engineering
assessment

Monitoring

Analytics

Planning

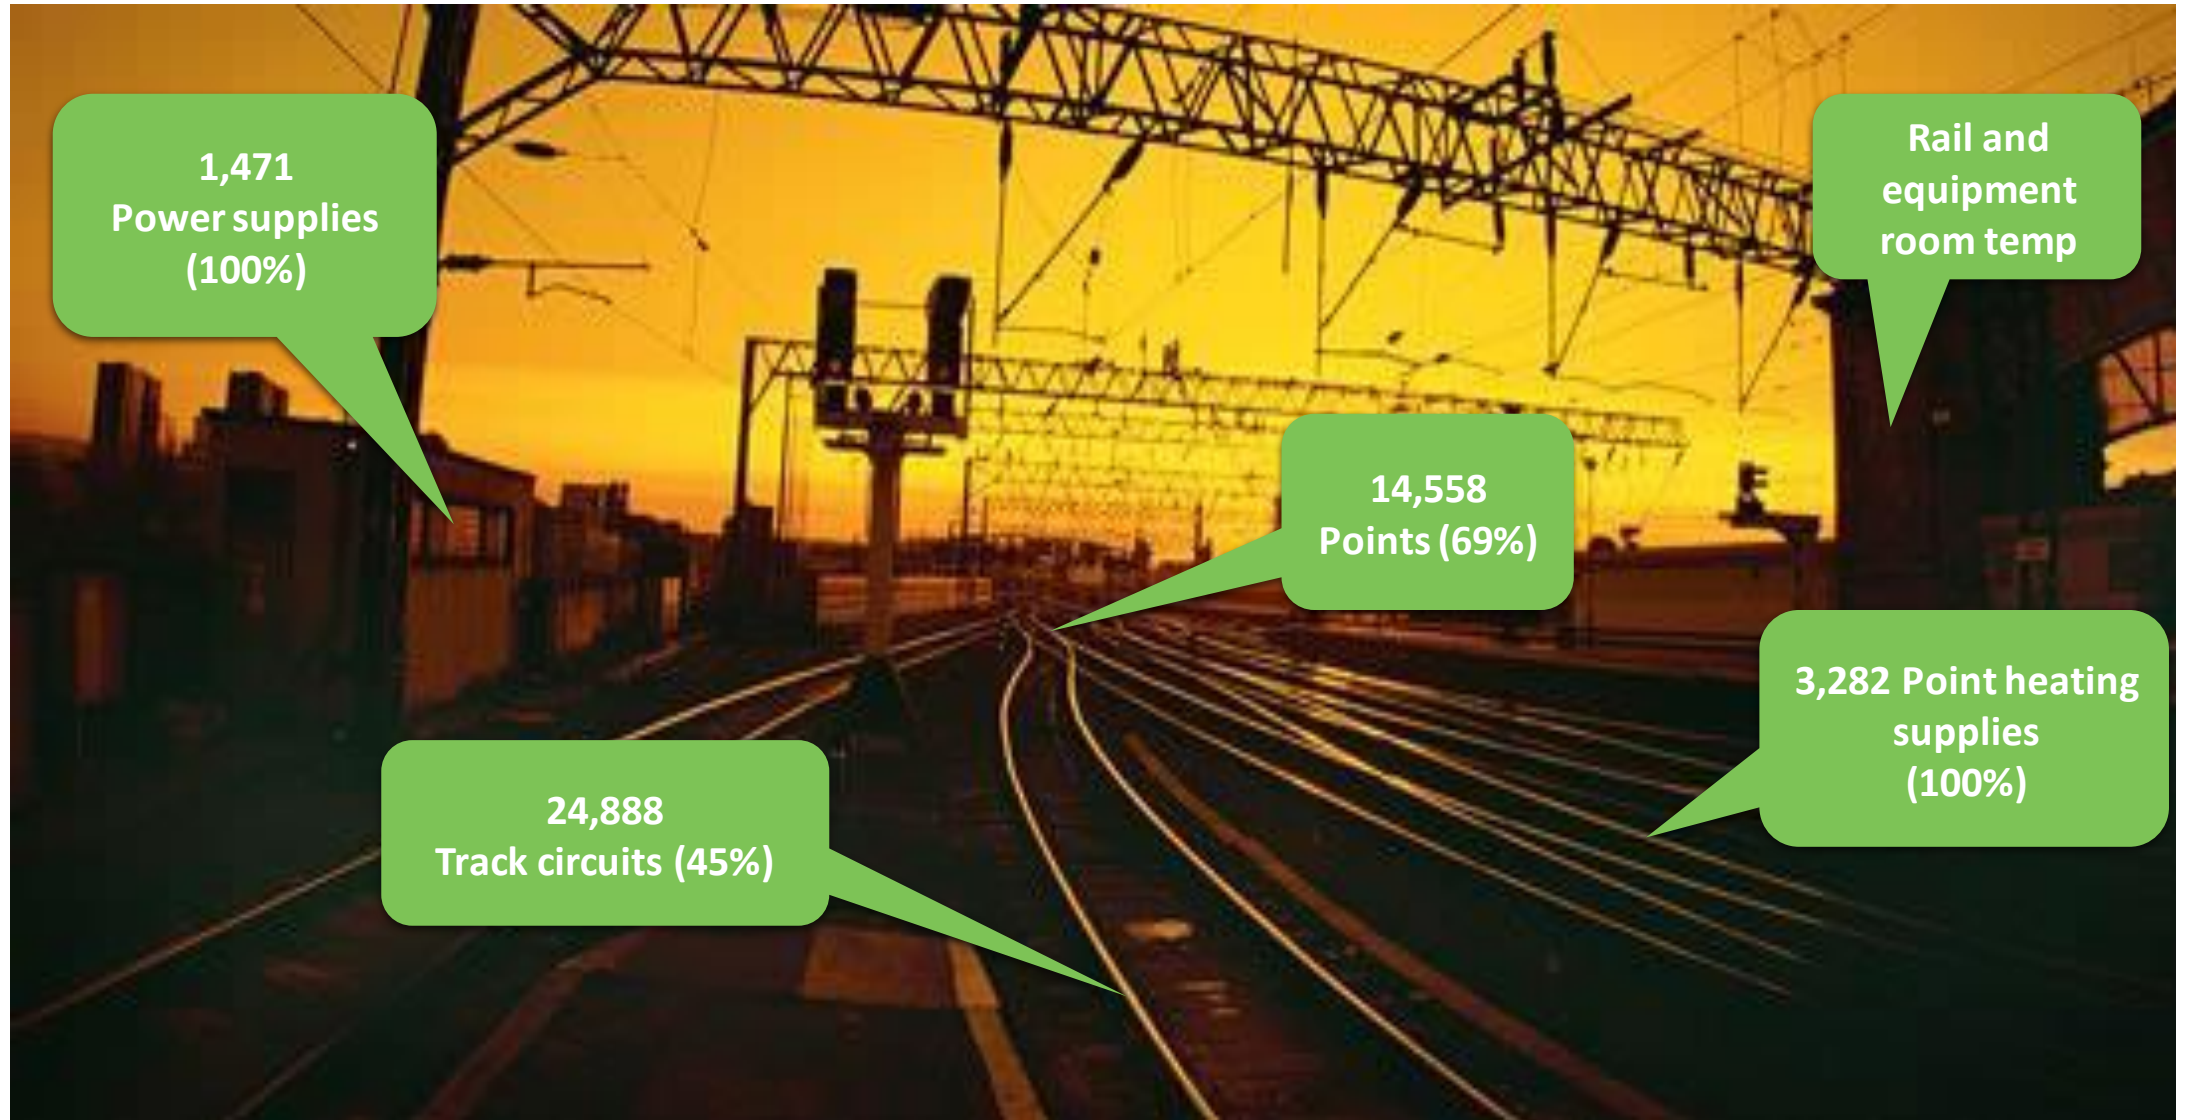

Execution

Continual feedback to evolve to meet the needs of passengers

Remote condition monitoring coverage

A yellow high-speed train, numbered 32345, is stopped at a platform. The train has a sleek, aerodynamic design with a large front window and a prominent nose. It is positioned on tracks next to a concrete platform. The background shows a clear sky and some distant structures.

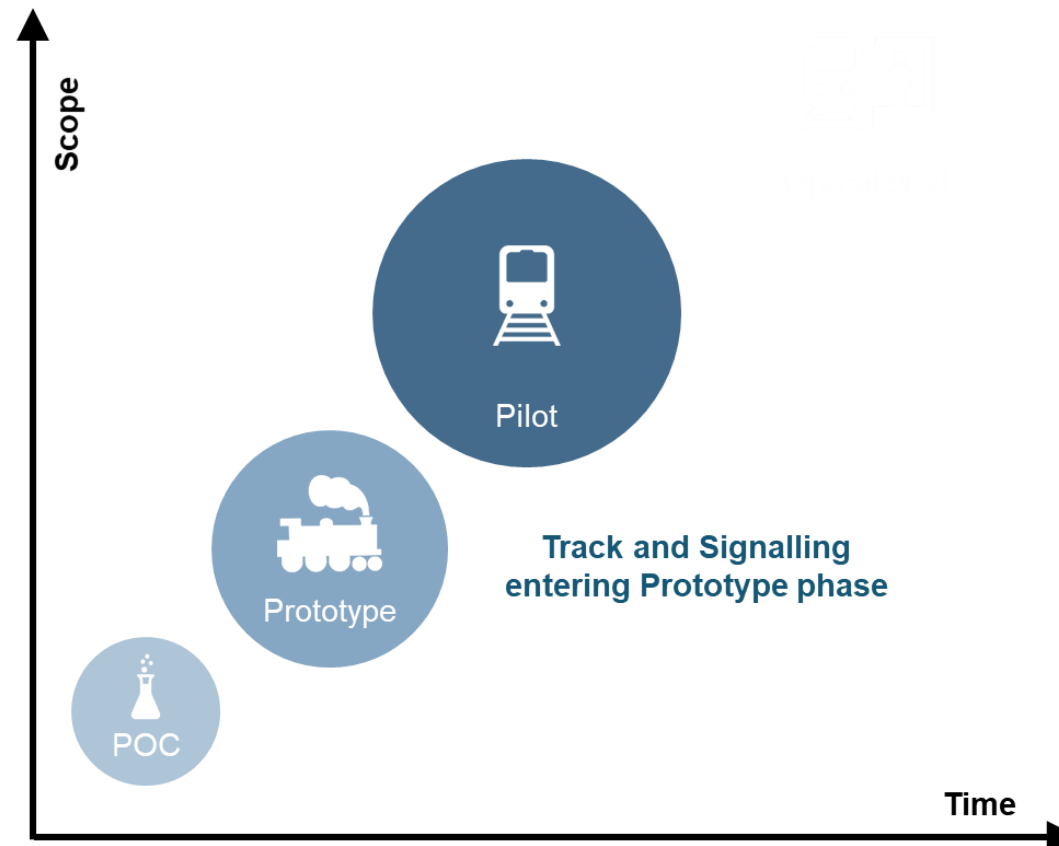

Specifying our requirements

- We need to do more to tell the supply chain what we need – an additional level of detail compared the challenge statements
- Detailed requirements being developed for S&C monitoring so suppliers understand what we need, rather than having to guess!
- We also need to change how we buy things

Analytics development

- Focused on using Advanced Analytics and Machine Learning (ML) to improve prediction of faults:
 - Deliver analytics solutions for the workstreams for deployment in the Insight tool
 - Diagnosing faults that will support making the correct intervention to reduce delays
 - Deliver proof of concept (POC) outcomes to inform the customers of the 'Art of the Possible'.

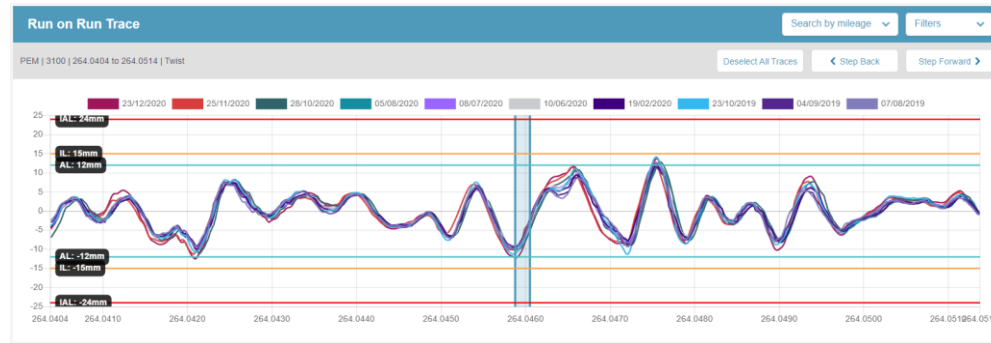

Using agile to deliver faster

The Insight Tool

Insight is our tool for presentation of information to Engineers and Section Managers. In our first release we have aligned track geometry trace data and built algorithms so users can understand when a threshold will be exceeded

Automatically aligned Track Geometry Traces

Visualising Cyclic Top Faults

Predicting Track Geometry Threshold Exceedances

Predicting Cyclic Top Threshold Exceedances

Delivering for the frontline

- User focused, simple to use tools
- Automating manual tasks
- Remote monitoring to understand current asset state
- Predict time to failure and root cause
- Providing data when and where it is needed
- Safer delivery of planned activity
- Right work, in the right place, at the right time

**Technical
Authority**

Providing technical leadership
